Design Studio Feedback

Phil Cutler

November 14, 2015

We did the peer feedback session with Brian Kimmig and Jimmy Moore.

Unfortunately, most of the issues raised in the feedback session were immediately answered, and we did not have any much constructive criticism to shape our design around. Most of the feedback was positive which seems fair, but not particularly helpful when it comes to revising the design.

Perhaps the only worry raised by both the group and the TA was a potentially shifting data representation because the Legion programming language is still evolving. The way we resolved this was by designing the visualization based on the attributes of each task that we knew we could extract (like CPU ID, start and end times, etc.) because the existing profiler uses those attributes already. The profiler can then be expanded to account for new information without ruining the work done so far.

One piece of positive feedback that has been accounted for was a comment that the main view is good. This view is really the core of the visualization, so it has been the primary focus of this milestone besides the data processing.

There may have been other issues, but there were no issues notable enough to record in the notes.
